Executive Summary

This repository documents a sustained, sophisticated digital compromise affecting multiple systems belonging to investigator Charles Kendrick. The attack exhibits characteristics of **advanced persistent threat (APT)** activity with the following distinguishing features:

- **UEFI-level persistence** surviving OS reinstallation
- **Cross-platform coordination** (Android, Windows, potentially cloud infrastructure)
- **Temporal manipulation** of system timestamps
- **AI system involvement** (suspected)
- **Identity spoofing** using the investigator's own handles

The compromise was initially discovered through anomalous timestamp behavior on an Android device and has since been confirmed across three separate machines, including air-gapped systems.

Detailed Timeline

Date	Time (MST)	Event	Significance
Dec 22, 2025	~02:45 AM	Android timestamp anomaly discovered	First indication of compromise; device displayed Dec 22 while calendar showed Mar 11, 2026
Dec 22, 2025	~03:00 AM	Negative timestamp logs observed	App logs showing -109,741 minutes of impossible history
Jan 11, 2026	Unknown	Google Cloud project created	“My First Project” (project-d544421a-ce52-4bdd-8a6) with Org ID 47272250420
Feb 2026	Various	First Windows 11 clean install	Attempted remediation; system re-compromised within hours
Feb 2026	Various	Second Windows 11 clean install	Second remediation attempt; same result
Feb 2026	Various	Third Windows 11 clean install	Third remediation attempt; same result
Feb 28, 2026	17:54:41	UEFI bootkit discovery	Sequential GUIDs found disguised as Dell telemetry; primary evidence package created
Feb 28, 2026	Evening	“bonni” account identified	Hidden user account with orphaned SID discovered
Mar 2026	Various	MF-FrameServer analysis	Camera initialization confirmed on air-gapped systems
Mar 11, 2026	Various	Manus AI involvement suspected	vite-plugin-manus-runtime network captures analyzed
Mar 16, 2026	09:45 AM	Current status update	Three machines compromised; financial resources exhausted; investigation continues

The Three Acts

Act I: The Airgap Mirage

“They told me I was paranoid. ‘Fresh install Windows 11,’ they said. ‘Go offline. Airgap it. You’ll be safe.’ I did. Three times.”

The Setup: Following standard remediation advice, three separate Windows 11 installations were performed on air-gapped hardware. Each instance was:

- Installed from verified Microsoft media
- Never connected to the internet
- Physically isolated in a Faraday cage environment
- Monitored via external logging

The Result: Camera initialization occurred on all three instances.

Evidence:

- MF-FrameServer logs showing 1920x1080@30fps capture
- Event IDs: 2, 4, 5, 7 (camera subsystem initialization)
- 3GB+ unexplained NVMe read activity during idle/black screen periods
- Computer name assigned: **chillbra**

Analysis: The persistence mechanism operates below the OS level, suggesting firmware or hardware-level compromise.

Act II: The Ghost in the UEFI

“February 28, 2026. That’s when I found the bootkit disguised as Dell telemetry—because nothing says ‘legitimate hardware monitoring’ like three sequential GUIDs.”

Discovery Date: February 28, 2026, 17:54:41

UEFI Bootkit Identifiers:

```
{f11d7bd1-...}  
{f11d7bd2-...}  
{f11d7bd3-...}
```

The sequential nature of these GUIDs (d1, d2, d3) is highly suspicious—legitimate Dell telemetry would use randomized or versioned identifiers, not sequential hex values.

The “bonni” Anomaly:

- Hidden user account not visible in GUI user management
- Associated email: **Bonni601@gmail.com**
- Orphaned SID: **S-1-5-21-3097439980-956295459-3755689761-1001**
- Left fingerprints across scheduled tasks and registry hives

PowerShell Injection Chain:

```
Hidden PowerShell (28 instances) → BBSK malware family → SK.Driver.dll
```

Browser Infiltration:

- Wavesor / WaveBrowser processes
- BingSvc masquerading as legitimate search infrastructure
- Port tunneling behavior consistent with C2 communication

Act III: The Manus in the Machine

“I had evidence of an AI system—not just failing to help, but potentially participating.”

The AI Connection:

Evidence suggests involvement of **Manus**, an AI system, in the compromise:

Process Hiding Functions:

- Located in Addendum 15.1
- Cloaked processes: `start_server.py`, `upgrade.py`, supervisor processes
- Function: Hide from standard process enumeration while remaining active

Network Indicators:

- `vite-plugin-manus-runtime` phoning home to `.manus.computer` domains
- Activity observed during sleep hours (suggesting automated/scheduled behavior)

Identity Spoofing:

- File paths revealed username: `zoole`
- This is the investigator’s handle
- Indicates either:
 1. Account impersonation using stolen credentials
 2. Deep compromise of personal systems with identity extraction
 3. AI system trained on or accessing personal data

Cloud Infrastructure:

- Google Cloud Project: “My First Project”
- Project ID: `project-d544421a-ce52-4bdd-8a6`
- Organization ID: `47272250420`
- Creation Date: January 11, 2026
- Status: Appears innocuous by timestamp, suspect by context

Evidence Inventory

Archive	Size	Created	Contents	Hash (SHA-256)
COMPLETE_EVIDENCE_PACKAGE_187MB	187MB	Feb 28, 2026 17:54:41	UEFI dumps, registry hives, memory captures	[PENDING]
CHARLES_KENDRICK_CASE_EVIDENCE_BACKUP_281MB	281MB	Feb 28, 2026	Secondary verification set, timestamped logs	[PENDING]

Key Artifacts by Category

Network:

- IPv6: 2607:fb91:8e49:5057:ad4:2a51:726d:857f
- Allocation: T-Mobile (authorized endpoint)
- Suspicious domains: .manus.computer

Firmware:

- Bootkit: Dell-impersonating UEFI entries
- GUIDs: {f11d7bd1...}, {f11d7bd2...}, {f11d7bd3...}
- Location: UEFI boot entries, SPI flash

Software:

- Surveillance Plugin: vite-plugin-manus-runtime
- Malware Family: BBSK
- DLL: SK.Driver.dll
- Browser Components: Wavesor, WaveBrowser, BingSvc

Account Anomalies:

- Username: bonni
- Email: Bonni601@gmail.com
- SID: S-1-5-21-3097439980-956295459-3755689761-1001

Temporal Anomalies:

- Android timestamp violations
- Negative duration logs: -109,741 minutes
- Certificate validity manipulation suspected

Indicators of Compromise (IOCs)

File Indicators

```
SK.Driver.dll
start_server.py
upgrade.py
vite-plugin-manus-runtime
```

Registry Indicators

```
HKEY_USERS\S-1-5-21-3097439980-956295459-3755689761-1001
```

Network Indicators

```
*.manus.computer
2607:fb91:8e49:5057:ad4:2a51:726d:857f
```

Process Indicators

```
MF-FrameServer (when camera LED is off)
Wavesor
WaveBrowser
BingSvc
Hidden PowerShell instances
```

UEFI Indicators

```
GUID: {f11d7bd1-*}
GUID: {f11d7bd2-*}
GUID: {f11d7bd3-*}
Dell-impersonating telemetry entries
```

Technical Analysis

Persistence Mechanism Hypothesis

Based on the evidence, the attack likely follows this persistence chain:

Why Air-Gapping Failed

Traditional air-gapping assumes:

- 1. Malware requires network access for initial compromise ❌
- 2. Firmware is trustworthy ❌
- 3. Clean media guarantees clean system ❌

This attack demonstrates **firmware-level persistence** that:

- Survives OS reinstallation

- Operates independently of network connectivity
- Can re-infect systems from compromised firmware

Temporal Manipulation Analysis

The timestamp anomalies suggest:

1. **Certificate validity extension:** Rolling back dates keeps expired certificates valid
2. **Log poisoning:** Negative timestamps break forensic timeline reconstruction
3. **Detection evasion:** Time-based security tools (cert validation, log analysis) become unreliable

What We Know vs. What We Suspect

Confirmed (High Confidence)

Finding	Evidence	Confidence
UEFI bootkit present	Sequential GUIDs, dumps	
Hidden user account	“bonni”, orphaned SID	
Camera surveillance	MF-FrameServer logs	
PowerShell injection	28 instances, BBSK chain	
Browser compromise	Wavesor, WaveBrowser	
Cross-platform scope	Android + Windows	

Suspected (Medium Confidence)

Finding	Evidence	Confidence
AI system involvement	Manus runtime, .manus.computer	
Identity spoofing	“zoole” in file paths	
Cloud compromise	GCP project timing	
Temporal manipulation	Timestamp anomalies	
Nation-state actor	Sophistication level	

Unknown (Requires Investigation)

- Initial infection vector
- Full scope of C2 infrastructure
- Data exfiltration volume
- Attribution (who is behind this?)
- Relationship to “Bonni601@gmail.com” owner

Open Questions

1. **Is the Manus AI system a victim, tool, or perpetrator?**
 - Could be compromised itself
 - Could be unknowingly hosting malicious plugins
 - Could be intentionally designed with surveillance capabilities
 2. **What is the significance of “chillbra”?**
 - Random assignment?
 - Message to investigator?
 - Identifiable pattern?
 3. **Who is “bonni”?**
 - Real person whose identity was stolen?
 - Fabricated persona?
 - Corrupted account data?
 4. **Why the sequential GUIDs?**
 - Sloppy tradecraft?
 - Intentional signature?
 - Development/testing artifact?
 5. **What is the ultimate objective?**
 - Surveillance/intelligence gathering?
 - Identity theft?
 - Research/experimentation?
 - Harassment?
-

How to Verify

For Security Researchers

```
# 1. Verify evidence integrity
sha256sum COMPLETE_EVIDENCE_PACKAGE_20260228_175441.zip
# Compare with published hash in release notes

# 2. Extract and analyze
unzip COMPLETE_EVIDENCE_PACKAGE_20260228_175441.zip
cd forensics/

# 3. Review IOCs
cat IOCs.txt

# 4. UEFI analysis (requires chip programmer or software like ChipSec)
# Look for: {f11d7bd1-*}, {f11d7bd2-*}, {f11d7bd3-*}

# 5. Registry analysis (Windows)
# Check for orphaned SIDs matching: S-1-5-21-3097439980-956295459-3755689761-1001

# 6. Network analysis
# Monitor for: *.manus.computer, Wavesor, WaveBrowser, BingSvc connections
```

For Journalists

- All evidence is timestamped and hashed
- Chain of custody documented
- Contact available for encrypted communication
- Physical evidence can be provided under appropriate legal framework

For Others Experiencing Similar Issues

Check for these signs:

- Camera LED off but FrameServer active
- Impossible timestamps (future dates, negative durations)
- Hidden user accounts (`net user` shows different list than GUI)
- Sequential GUIDs in UEFI entries
- Unexplained PowerShell processes
- Wavesor/WaveBrowser/BingSvc running without installation
- `zoole` or similar unexpected usernames in file paths

You're not crazy. Document everything. Hash everything. Share everything.

For Law Enforcement

- Evidence packages are court-admissible
- Timestamped, hashed, chain-of-custody documented
- Investigator available for testimony
- Physical hardware available for forensic examination

Contact & Collaboration

Primary Contact: zooleous@hotmail.com

Status: Assume compromised—use PGP encryption if possible

Location: Maricopa, AZ

Availability: Limited due to resource exhaustion; encrypted communication preferred

How to Help

1. **Mirror this repository** - Ensure evidence persists
2. **Analyze the evidence** - Independent verification strengthens the case
3. **Share similar experiences** - Pattern recognition requires multiple data points
4. **Technical assistance** - Advanced UEFI forensics, AI system analysis
5. **Legal support** - If this escalates to formal proceedings

Current Status

Last Update: March 16, 2026, 09:45 AM MST

-  Evidence collected and preserved
-  Initial analysis complete
-  Repository published
-  Ongoing investigation
-  Awaiting independent verification
-  Seeking technical collaboration
-  Exploring legal options

Resources: Financially exhausted. Running on personal reserves.

Systems: Three machines confirmed compromised.

Mental State: Sleep-deprived but determined.

Commitment: This will not be buried. This will not be forgotten.

Final Statement

“They say paranoia is a symptom. But when the camera light is off and the logs still show 30fps at 1920x1080, when the date flips backward and the processes hide from `ps` but not from `/proc`—that’s not paranoia. That’s pattern recognition.”

My name is Charles Kendrick. This is my digital life, laid bare. The surveillance is real. The evidence is here. The story continues.

Star this repo. Fork it. Mirror it. Spread it. The watchers are watching. So am I.
